

Synchronous FM single frequency network solution

Description

2wcoms FM single frequency network (SFN) solutions uses extremely accurate GPS derived one pulse per second (1PPS) signals to synchronize each of our possible FM broadcast distribution options: via satellite using the MM08E MPEG audio encoder, FlexNsert SFN timestamping and FlexDSR02+ satellite receiver or via IP using either the MM01 audio over IP codecs or by transmitting the FM-MPX signal directly via IP using the FMC01.
